## ABSTRACT

## PACKAGED ELECTRONIC COMPONENT FOR APPLICATIONS AT MILLIMETRIC FREQUENCIES

The invention relates to millimetric packaged electronic components for applications at high frequencies greater than 45 GHz.

According to the invention, to facilitate the design of system including MMIC chips working frequencies, it is proposed to use packages containing one or more chips (22), these packages making possible to work at these frequencies and including two types of port: a port (30) with transition electromagnetic coupling providing contactless antenna at the high connection with an frequency F via a waveguide; and a port (40) with microstrip or coaxial line type transition enabling a connection at a subharmonic frequency F/N (preferably N= 6 or 4 or, if necessary, 3) of the working frequency.

Application: radar systems.
